ROGDI Recall Exam Questions

1. What disease is the ROGDI case study about?
Answer:

2. What is the Orphanet ID for the ROGDI/KTS disease case?
Answer:

3. What are the two OMIM identifiers used in the ROGDI audit?
Answer:

4. What is the correct gene symbol for the case study?
Answer:

5. What is the correct UniProt accession for human ROGDI?
Answer:

6. What is the recommended protein name for UniProt Q9GZN7?
Answer:

7. What are three aliases for ROGDI?
Answer:

8. What chromosome location is listed for ROGDI?
Answer:

9. What is the protein length of ROGDI?
Answer:

ROGDI Recall Exam Questions (continued)

12. Why is source verification the first step before scoring a gene therapy target?
Answer:

13. Which source is used to confirm protein identity and sequence facts?
Answer:

14. Which source is used to anchor rare disease identity?
Answer:

15. Which source is used for disease and gene OMIM entries?
Answer:

16. What live UniProt facts were checked for Q9GZN7?
Answer:

17. What is the inheritance pattern of Kohlschutter-Tonz syndrome?
Answer:

18. Why does autosomal recessive loss of function support gene addition?
Answer:

19. What are the three classic features of KTS described in the audit?
Answer:

20. Name three additional clinical features reported in KTS.
Answer:

ROGDI Recall Exam Questions (continued)

23. How should ROGDI be treated functionally for gene therapy planning?
Answer:

24. What two PDB structures are linked to human ROGDI?
Answer:

25. What domain or family annotations are listed for ROGDI?
Answer:

26. What 2025 biology connection is important for ROGDI?
Answer:

27. Why does the Rabconnectin-3/V-ATPase link matter?
Answer:

28. Is ROGDI secreted?
Answer:

29. Why does non-secreted localization make gene therapy harder?
Answer:

30. What is cell-autonomous rescue?
Answer:

31. What is cross-correction?
Answer:
